#### History

Grothendieck polynomials and their variations are *K*-theory analogues of Schubert and Schur polynomials.

## History

Grothendieck polynomials and their variations are K-theory analogues of Schubert and Schur polynomials.

 Grothendieck polynomials (Lascoux-Schützenberger '82): polynomial representatives of structure sheaves of Schubert varieties in the K-theory of flag manifolds

## History

Grothendieck polynomials and their variations are *K*-theory analogues of Schubert and Schur polynomials.

- Grothendieck polynomials (Lascoux-Schützenberger '82): polynomial representatives of structure sheaves of Schubert varieties in the K-theory of flag manifolds
- stable Grothendieck polynomials (Fomin-Kirillov '96): symmetric power series representatives of structure sheaves of Schubert varieties in the K-theory of the Grassmannian

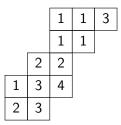

## History

Grothendieck polynomials and their variations are *K*-theory analogues of Schubert and Schur polynomials.

- Grothendieck polynomials (Lascoux-Schützenberger '82): polynomial representatives of structure sheaves of Schubert varieties in the K-theory of flag manifolds
- stable Grothendieck polynomials (Fomin-Kirillov '96): symmetric power series representatives of structure sheaves of Schubert varieties in the K-theory of the Grassmannian
- dual stable Grothendieck polynomials (Lam-Pylyavskyy '07): symmetric functions which are the continuous dual basis to the stable Grothendieck polynomials with respect to the Hall inner product

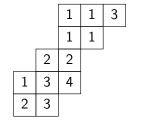

#### Reverse plane partitions

A reverse plane partition (rpp) is a filling of a skew diagram  $\lambda/\mu$  with positive integers such that entries are weakly increasing along rows and columns.

#### Irredundant content

We define the *irredundant content* of an rpp T to be the sequence  $c(T) = (c_1, c_2, c_3, ...)$  where  $c_i$  is the number of *columns* of T which contain an *i*.

$$c(T) = (3, 3, 2, 1, 0, 0, \dots)$$

#### Dual stable Grothendieck polynomials

For each skew shape  $\lambda/\mu$ , define

$$g_{\lambda/\mu} = \sum_{\substack{ T \text{ is an rpp} \\ ext{ of shape } \lambda/\mu}} x^{c(T)}$$

where  $x^{(c_1,c_2,c_3,...)} = x_1^{c_1} x_2^{c_2} x_3^{c_3} \cdots$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Dual stable Grothendieck polynomials

For each skew shape  $\lambda/\mu$ , define

$$g_{\lambda/\mu} = \sum_{\substack{T \text{ is an rpp} \\ \text{ of shape } \lambda/\mu}} x^{c(T)}$$

where  $x^{(c_1,c_2,c_3,...)} = x_1^{c_1} x_2^{c_2} x_3^{c_3} \cdots$ .

The  $g_{\lambda/\mu}$  are called *dual stable Grothendieck polynomials*.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへ⊙

#### Dual stable Grothendiecks are symmetric

Theorem (Lam-Pylyavskyy '07)

For every  $\lambda/\mu$ , the power series  $g_{\lambda/\mu}$  is symmetric in the  $x_i$ .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

#### Dual stable Grothendiecks are symmetric

Theorem (Lam-Pylyavskyy '07)

For every  $\lambda/\mu$ , the power series  $g_{\lambda/\mu}$  is symmetric in the  $x_i$ .

Their proof uses Fomin-Greene operators—fundamentally combinatorial, but the combinatorics are mysterious.

#### Dual stable Grothendiecks are symmetric

Theorem (Lam-Pylyavskyy '07)

For every  $\lambda/\mu$ , the power series  $g_{\lambda/\mu}$  is symmetric in the  $x_i$ .

Their proof uses Fomin-Greene operators—fundamentally combinatorial, but the combinatorics are mysterious.

Our result: A bijective proof of this theorem.

#### Dual stable Grothendiecks are symmetric

Theorem (Lam-Pylyavskyy '07)

For every  $\lambda/\mu$ , the power series  $g_{\lambda/\mu}$  is symmetric in the  $x_i$ .

Their proof uses Fomin-Greene operators—fundamentally combinatorial, but the combinatorics are mysterious.

Our result: A bijective proof of this theorem.

 Bijection is a generalization of the Bender-Knuth involutions for semistandard tableaux.

## Schur functions

A semistandard Young tableau (SSYT) is a filling of a skew diagram  $\lambda/\mu$  with positive integers such that entries are weakly increasing along rows and *strictly* increasing down columns.

#### Schur functions

A semistandard Young tableau (SSYT) is a filling of a skew diagram  $\lambda/\mu$  with positive integers such that entries are weakly increasing along rows and *strictly* increasing down columns.

For each skew shape  $\lambda/\mu$ , define the *Schur function* 

$$s_{\lambda/\mu} = \sum_{\substack{T \text{ is a SSYT} \\ \text{ of shape } \lambda/\mu}} x^{c(T)}.$$

## Schur functions

A semistandard Young tableau (SSYT) is a filling of a skew diagram  $\lambda/\mu$  with positive integers such that entries are weakly increasing along rows and *strictly* increasing down columns.

For each skew shape  $\lambda/\mu$ , define the *Schur function* 

$$s_{\lambda/\mu} = \sum_{\substack{T \text{ is a SSYT} \\ ext{ of shape } \lambda/\mu}} x^{c(T)}.$$

The *Bender-Knuth involutions* are a way to prove the  $s_{\lambda/\mu}$  are symmetric.

Let S be the set of all intermediate tableaux that can be achieved during the above algorithm.

### A lemma

Let S be the set of all intermediate tableaux that can be achieved during the above algorithm.

For T.  $T' \in S$ , write  $T \xrightarrow{u} T'$  if T' is obtained from T by resolving a descent in columns u, u + 1.

## A lemma

Let S be the set of all intermediate tableaux that can be achieved during the above algorithm.

For T,  $T' \in S$ , write  $T \xrightarrow{u} T'$  if T' is obtained from T by resolving a descent in columns u, u + 1.

Write  $T \xrightarrow{*} T'$  if T' can be obtained from T through a sequence of descent resolutions.

### A lemma

Let S be the set of all intermediate tableaux that can be achieved during the above algorithm.

For T.  $T' \in S$ , write  $T \xrightarrow{u} T'$  if T' is obtained from T by resolving a descent in columns u, u + 1.

Write  $T \xrightarrow{*} T'$  if T' can be obtained from T through a sequence of descent resolutions.

#### Lemma

If T,  $T_{\mu}$ , and  $T_{\nu} \in S$  such that  $T \xrightarrow{u} T_{\mu}$  and  $T \xrightarrow{v} T_{\nu}$ , then there exists  $T' \in S$  such that  $T_{\mu} \stackrel{*}{\to} T'$  and  $T_{\nu} \stackrel{*}{\to} T'$ .

# Proof of lemma

#### Lemma

If T,  $T_u$ , and  $T_v \in S$  such that  $T \xrightarrow{u} T_u$  and  $T \xrightarrow{v} T_v$ , then there exists  $T' \in S$  such that  $T_u \xrightarrow{*} T'$  and  $T_v \xrightarrow{*} T'$ .

# Proof of lemma

#### Lemma

If T,  $T_u$ , and  $T_v \in S$  such that  $T \xrightarrow{u} T_u$  and  $T \xrightarrow{v} T_v$ , then there exists  $T' \in S$  such that  $T_u \xrightarrow{*} T'$  and  $T_v \xrightarrow{*} T'$ .

Proof: If  $|u - v| \ge 2$ , then the result is easy.

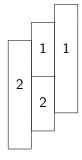

# Proof of lemma

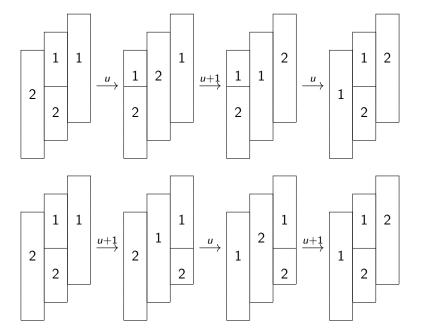

#### Lemma

If T,  $T_u$ , and  $T_v \in S$  such that  $T \xrightarrow{u} T_u$  and  $T \xrightarrow{v} T_v$ , then there exists  $T' \in S$  such that  $T_u \xrightarrow{*} T'$  and  $T_v \xrightarrow{*} T'$ .

Proof: If  $|u - v| \ge 2$ , then the result is easy.

Assume u = v - 1. Columns u, u + 1, u + 2 must look like:

(日) (四) (王) (王) æ

#### Newman's Lemma

Note about the above proof: We are implicitly basing our argument on *Newman's lemma* (or the *diamond lemma*): A terminating rewriting system is confluent if it locally confluent.

# Definition of $B_1$

- Let  $T \in \mathsf{RPP}(\lambda/\mu)$ . Construct  $B_1(T)$  from T as follows.
  - Change all 1-pure columns to 2-pure columns and all 2-pure columns to 1-pure columns (of the same length).
  - 2 "Resolve descents" one at a time until none remain.
    - How do we know that this process will terminate?
      - Look at positions of 1-pure and 2-pure columns.
    - How do we know the end result is unique?

# Definition of $B_1$

- Let  $T \in \mathsf{RPP}(\lambda/\mu)$ . Construct  $B_1(T)$  from T as follows.
  - Change all 1-pure columns to 2-pure columns and all 2-pure columns to 1-pure columns (of the same length).
  - 2 "Resolve descents" one at a time until none remain.
    - How do we know that this process will terminate?
      - Look at positions of 1-pure and 2-pure columns.
    - How do we know the end result is unique?
      - We do.

# Definition of $B_1$

- Let  $T \in \mathsf{RPP}(\lambda/\mu)$ . Construct  $B_1(T)$  from T as follows.
  - Change all 1-pure columns to 2-pure columns and all 2-pure columns to 1-pure columns (of the same length).
  - 2 "Resolve descents" one at a time until none remain.
    - How do we know that this process will terminate?
      - Look at positions of 1-pure and 2-pure columns.
    - How do we know the end result is unique?
      - We do.

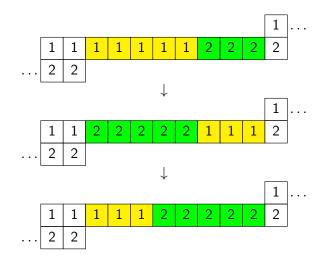

Easy to check that  $B_1 : \operatorname{RPP}(\lambda/\mu) \to \operatorname{RPP}(\lambda/\mu)$  is an involution.

# Definiton of $B_1$

- Let  $T \in \mathsf{RPP}(\lambda/\mu)$ . Construct  $B_1(T)$  from T as follows.
  - Change all 1-pure columns to 2-pure columns and all 2-pure columns to 1-pure columns (of the same length).
  - 2 "Resolve descents" one at a time until none remain.
    - How do we know that this process will terminate?
      - Look at positions of 1-pure and 2-pure columns.
    - How do we know the end result is unique?
      - We do.

Easy to check that  $B_1 : \operatorname{RPP}(\lambda/\mu) \to \operatorname{RPP}(\lambda/\mu)$  is an involution.

Thus,  $g_{\lambda/\mu}$  is symmetric.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

#### Generalized Bender-Knuth involutions

The  $B_i$  are the unique extensions of the Bender-Knuth involutions (to rpp) that satisfies a certain "locality" condition (see the last section of our paper).

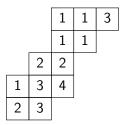

#### Generalized Bender-Knuth involutions

The  $B_i$  are the unique extensions of the Bender-Knuth involutions (to rpp) that satisfies a certain "locality" condition (see the last section of our paper).

The  $B_i$  also give some additional structure to RPP( $\lambda/\mu$ ) beyond the above symmetry: they preserve some of the behavior between adjacent rows of an rpp.

#### The statistic ceq

For  $T \in \mathsf{RPP}(\lambda/\mu)$ , define  $\mathsf{ceq}(T) = (q_1, q_2, q_3, ...)$  where  $q_i$  is the number of vertically adjacent pairs of cells in rows i, i + 1 of T with equal entries.

$$ceq(T) = (2, 0, 0, 1, 0, 0, ...)$$

#### Refined dual stable Grothendieck polynomials

For each skew shape  $\lambda/\mu$ , define

$$ilde{g}_{\lambda/\mu} = \sum_{T \in RPP(\lambda/\mu)} t^{\operatorname{ceq}(T)} x^{c(T)}$$

where  $t^{(q_1,q_2,q_3,...)} = t_1^{q_1} t_2^{q_2} t_3^{q_3} \cdots$ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

#### Refined dual stable Grothendieck polynomials

For each skew shape  $\lambda/\mu$ , define

$$ilde{g}_{\lambda/\mu} = \sum_{T \in RPP(\lambda/\mu)} t^{\operatorname{ceq}(T)} x^{c(T)}$$

where 
$$t^{(q_1,q_2,q_3,...)} = t_1^{q_1} t_2^{q_2} t_3^{q_3} \cdots$$
.

If 
$$t = 1$$
, then  $\tilde{g}_{\lambda/\mu} = g_{\lambda/\mu}$ .  
If  $t = 0$ , then  $\tilde{g}_{\lambda/\mu} = s_{\lambda/\mu}$ .

#### Refined dual stable Grothendieck polynomials

For each skew shape  $\lambda/\mu$ , define

$$ilde{g}_{\lambda/\mu} = \sum_{T \in RPP(\lambda/\mu)} t^{\operatorname{ceq}(T)} x^{c(T)}$$

where 
$$t^{(q_1,q_2,q_3,...)} = t_1^{q_1} t_2^{q_2} t_3^{q_3} \cdots$$
.

If 
$$t = 1$$
, then  $\tilde{g}_{\lambda/\mu} = g_{\lambda/\mu}$ .  
If  $t = 0$ , then  $\tilde{g}_{\lambda/\mu} = s_{\lambda/\mu}$ .

From the previous proof,  $\tilde{g}_{\lambda/\mu}$  is symmetric in x.

#### An example and a conjecture

Example: If  $\lambda/\mu$  is a single column with *n* cells, then

$$\tilde{g}_{\lambda/\mu}=e_n(t_1,t_2,\ldots,t_{n-1},x_1,x_2,\ldots).$$

#### An example and a conjecture

Example: If  $\lambda/\mu$  is a single column with *n* cells, then

$$\tilde{g}_{\lambda/\mu}=e_n(t_1,t_2,\ldots,t_{n-1},x_1,x_2,\ldots).$$

Conjecture (Grinberg):

$$\widetilde{g}_{\lambda'/\mu'} = \detig(e_{\lambda_i-\mu_j-i+j}(t_{\mu_j+1},\ldots,t_{\lambda_i-1},x_1,x_2,\ldots)ig)_{i,j=1}^{\ell(\lambda)}$$

Thank you!
